Release Your Software

 Jul 02, 2013

 technoweenie

 Announcements

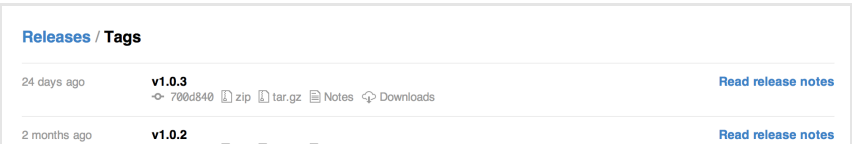

Today, we’re excited to announce **Releases**, a workflow for shipping software to end users. Releases are first-class objects with changelogs and binary assets that present a full project history beyond Git artifacts. They’re accessible from a repository’s homepage:

Releases are accompanied by release notes and links to download the software or source code.

Following the conventions of many Git projects, releases are tied to Git tags. You can use an existing tag, or let releases create the tag when it’s published.
