Android Studio push tags to remote

I've recently started working with Android Studio and am using git (bitbucket). Whenever I create a stable/releasable version of an application I create a tag so that it becomes easier to spot all the versions among all the commits.

My trouble is that I have not found a way to push my tags to the remote from within Android Studio (either manually or automatically). Until now I have been using `git push --tags` through the command line to do the trick.

Is there any way to make it from inside the IDE or do I have to stick to this not so neat way?

Unfortunately, you can't push tags from IntelliJ IDEA/Android Studio.

<http://youtrack.jetbrains.com/issue/IDEA-77483>

EDIT:

Stack Overflow requires external JavaScript from another domain, which is blocked or failed to load.

Stack Overflow requires external JavaScript from another domain, which is blocked or failed to load.

You can use the Terminal window in Android Studio with this commands:

```
//push every local tag to remote  
git push origin --tags
```

```
//push a specific local tag to remote  
git push origin : tagName
```

These commands are usefull if you already have committed your changes

In AS, go to VCS>>Git>>Tag...

Stack Overflow requires external JavaScript from another domain, which is blocked or failed to load.

in Commit, you don't need to write anything if you want tag your project HEAD. Click on Create Tag.

Then, check the box to push tags to your remote server

and Push.

Stack Overflow requires external JavaScript from another domain, which is blocked or failed to load.

Once you connected with git tags can be created from Android Studio **menu>VCS>Git>tag..** Then push to that tag.
